INTRODUCTION

The purpose of this report is to provide the Transportation Analysis for the proposed development of the property located east of US 19 and north of Spring Hill Drive in Hernando County, Florida, as shown in Figure 1.

PROJECT DESCRIPTION

The property is currently vacant. The proposed project will consist of the following uses:

- 3 bay Quick Lube
- 3,000 square foot Coffee Shop with drive-through
- 5,500 square foot Fast Food Restaurant with Drive-Through
- 3,600 square foot Fast Food Restaurant with Drive-Through
- 3,500 square foot Medical Office.

The access for the project are proposed to be as follows.

- One (1) right-in/right-out access to US 19
- One (1) left-in/left-out/right-in/right-out access to US 19
- Connection to the frontage road to the north.

A conceptual site plan is included in the Appendix of this report.

Figure 1. Project Location

ESTIMATED DAILY PROJECT TRAFFIC

The trip rates utilized in this report were obtained from the latest computerized version of OTISS which utilizes the Institute of Transportation Engineers (ITE) Trip Generation, 11th Edition, 2021, as its database. Based on these trip rates, it is estimated that the proposed project will attract approximately 6,101 daily trip ends, as shown in Table 1.

Studies contained in the ITE Trip Generation, 11th Edition, indicate that a percentage of the project trips already exist on the adjacent roadways - passerby capture. Therefore, the new daily trip ends attracted to the proposed project would be 3,172 trip ends, as shown in Table 1.

ESTIMATED AM PROJECT TRAFFIC

Again, based on data contained in the ITE Trip Generation, 11th Edition, the proposed project would attract approximately 685 trip ends during the AM peak hour with 354 inbound and 331 outbound, as shown in Table 2.

As previously stated, studies contained in the ITE Trip Generation, 11th Edition, indicate that a percentage of the project trips already exist on the adjacent roadways - passerby capture. Therefore, the new AM peak hour trip ends attracted to the proposed project would be 352 trip ends with 184 inbound and 168 outbound, as shown in Table 2.

ESTIMATED PM PROJECT TRAFFIC

Again, based on data contained in the ITE Trip Generation, 11th Edition, the proposed project would attract approximately 444 trip ends during the PM peak hour with 227 inbound and 217 outbound, as shown in Table 3.

As previously stated, studies contained in the ITE Trip Generation, 11th Edition, indicate that a percentage of the projects trips already exist on the adjacent roadways - passerby capture. Therefore, the new PM peak hour trip ends attracted to the proposed project would be 215 trip ends with 109 inbound and 106 outbound, as shown in Table 3.

PROJECT TRIP DISTRIBUTION/ASSIGNMENT

The following distribution of the new AM and PM peak hour trip ends was based on the existing traffic and development patterns with hand assignment to the local network:

- 25% to and from the north (via US 19 and Trenton Avenue)
- 25% to and from the south (via US 19)
- 40% to and from the east (via Spring Hill Drive and Trenton Avenue)
- 10% to and from the west (via Osowaw Boulevard).

Table 4 shows the distribution of the new AM and PM peak hour project trip ends. Figure 2 and Figure 3 illustrate the AM and PM peak hour trip ends, respectively.

BUDGETED IMPROVEMENTS

According to the FDOT Work Program and the Hernando County Capital Improvement Program, there are no capacity adding projects budgeted within the vicinity of the project.

Table 4. Estimated New Peak Hour Project Traffic Distribution

Time Period	North (25%)		South (25%)		East (40%)		West (10%)		Total	
	<u>In</u>	<u>Out</u>	<u>In</u>	<u>Out</u>	<u>In</u>	<u>Out</u>	<u>In</u>	<u>Out</u>	<u>In</u>	<u>Out</u>
AM	46	42	46	42	74	67	18	17	184	168
PM	27	26	27	27	44	42	11	11	109	106

Figure 2. Project Traffic – AM Peak Hour

Figure 3. Project Traffic – PM Peak Hour

STUDY AREA

The study area for this analysis was determined to include all major road network facilities in which the peak hour project traffic consumes 4.5 percent or more of the adopted level of service capacity of the roadway. Table 5 shows the Study Area Determination for the project. As shown in the table, the project traffic does not consume more than 4.5 percent of the peak hour capacity on any of the adjacent links. Therefore, only the adjacent links will be included in the study area:

- US 19 from Spring Hill Drive to Trenton Avenue.

ADJACENT ROADWAYS

As stated previously, the site is located east of US 19 and north of Spring Hill Drive. US 19 is a six-lane divided roadway. Spring Hill Drive is a four (4) lane divided roadway. Pinehurst Drive is a two (2) lane undivided roadway. According to the FDOT Work Program and Hernando County Capital Improvement Plan, there are no other programmed capacity improvements in the vicinity of the project.

BUILDOUT

It is anticipated the project will have a 2026 buildout date.

Table 5. Study Area Determination

<u>Roadway</u>	<u>From</u>	<u>To</u>	<u>Lanes</u>	<u>Peak Hour Two-Way Capacity (1)</u>	<u>Percent Project Traffic</u>	<u>New PM Peak Hour Project Traffic</u>	<u>Percent Consumed</u>
US 19	Applegate Dr	Spring Hill Dr	6LD	5,390	21%	45	0.8%
	Spring Hill Dr	Trenton Ave	6LD	5,390	25%	54	1.0%
Spring Hill Dr	Kenlake Ave	US 19	4LD	3,222	20%	43	1.3%
Osoaw Blvd	US 19	Tarpon Blvd	2LU	1,197	10%	22	1.8%
Trenton Ave	US 19	Piedmont Dr	2LU	1,197	24%	51	4.3%

(1) Source: FDOT Generalized Level of Service Tables.

Local 4LD: $3,580 \times 0.90 = 3,222$

Local 2LU: $1,330 \times 0.90 = 1,197$

BACKGROUND TRAFFIC

The following methodology was utilized to estimate the existing volumes within the study area:

1. PALM TRAFFIC conducted AM (7:00 – 9:00) and PM (4:00 – 6:00) peak hour turning movement counts on Thursday, November 14, 2024, at the following intersections:
 - US 19 and Spring Hill Drive/Osowaw Boulevard
 - US 19 and Tarpon Boulevard
 - US 19 and Trenton Avenue (Thursday, July 17, 2025, PSCF – 1.09)
 - Trenton Avenue and Frontage Road/Forest Road (Thursday, July 17, 2025, PSCF - 1.09).

Figure 4 illustrates the existing traffic for the AM and PM peak hours.

2. The turning movement counts were adjusted to the peak season based on the FDOT Peak Season Adjustment Factors for Hernando County of 1.03. Figure 5 illustrates the peak season traffic for the AM and PM peak hours.
3. Based on FDOT historical traffic counts on US 19 in the area, there has been little to no growth over the past 10 years. To be conservative, an annual growth rate of 1.0 percent per year was used to determine the background traffic in the buildout year of 2026. Figure 6 illustrates the background traffic. Figure 7 and Figure 8 illustrate the AM and PM background plus project traffic, respectively.

Figure 4. Existing Traffic

Figure 5. Peak Season Traffic

Figure 6. Background Traffic

Figure 7. Background Plus Project Traffic – AM Peak Hour

Figure 8. Background Plus Project Traffic – PM Peak Hour

INTERSECTION ANALYSIS

Intersection analysis was conducted for the AM and PM peak hours at the following intersections:

- US 19 and Osowaw Boulevard/Spring Hill Drive
- US 19 and Tarpon Boulevard/Driveway B
- US 19 and Trenton Avenue
- Trenton Avenue and Frontage Road.

The analysis was based on SYNCHRO with the proposed project traffic. Table 6 summarizes the signalized intersection analysis results. The results are also described in the following paragraphs:

US 19 and Osowaw Boulevard/Spring Hill Drive

Signalized intersection analysis indicates that all the individual movements should operate with a volume to capacity (v/c) ratio less than 1.0 during the AM and PM peak hours with background plus project traffic.

US 19 and Tarpon Boulevard/Driveway B

The intersection is unsignalized. Unsignalized intersection analysis indicates that all movements should operate with a v/c ratio less than 1.0 during the background plus project traffic during the AM and PM peak hours.

US 19 and Trenton Avenue

Signalized intersection analysis indicates that all the individual movements should operate with a volume to capacity (v/c) ratio less than 1.0 during the AM and PM peak hours with background plus project traffic.

Trenton Avenue and Frontage Road

The intersection is unsignalized. Unsignalized intersection analysis indicates that all movements should operate with a v/c ratio less than 1.0 during the background plus project traffic during the AM and PM peak hours.

ACCESS ANALYSIS

The recommendations included in this report are based on a field review of the site, the proposed site plan and the Transportation Analysis. The methodology utilized to determine the need for a right and left turn lanes was based on the FDOT Multimodal Access Management Guidebook 2023. The access recommendations are summarized in Table 7 and described in the following paragraph:

US 19 and Driveway A

The proposed project driveway has right-in/right-out access to US 19. Based on the estimated traffic, a northbound right turn lane is warranted. Based on FDOT Design Manual 212-1, the design speed and the background plus project traffic, the turn lane should be 405 feet, which includes a 50-foot taper.

US 19 and Driveway B

This intersection has left-in/left-out/right-in/right-out access to US 19. Based on the estimated project traffic, a northbound right turn lane and a southbound left turn lane are warranted. Based on FDOT Design Manual 212-1, the design speed and the background plus project traffic, the northbound right turn lane should be 405 feet and the southbound left turn lane should be 455 feet. Both include a 50-foot taper.

Table 7. Access Recommendations

<u>Intersection</u>	<u>Movement</u>	<u>Peak Hour Volume (1)</u>	<u>Turn Lane Warranted?</u>	<u>Queue Storage (2)</u>	<u>Deceleration Length (3)</u>	<u>Required Length</u>
US 19 and Driveway A	NBR	126/83	Y	0'	405'	405'
US 19 and Driveway B	NBR	102/68	Y	0'	405'	405'
	SBL	66/37	Y	50'	405'	455'

(1) See Figures 7 and 8, Background Plus Project Traffic, from the report.

(2) Based on Synchro 95th percentile queue or a minimum of 50 feet for left turn lanes.

(3) Based on FDOT Design Manual 212-1 and a design speed of 60 mph on US 19.

GENERALIZED LINK ANALYSIS

A generalized link analysis was conducted for those roadways within the area of influence for the following traffic conditions:

- Peak Season Traffic
- Background Traffic
- Background Plus Project Traffic

Table 8 presents the results of the analysis for the general link analysis. According to the results shown in the table, there currently is excess capacity along US 19 during the peak season and background conditions. With the project traffic added to the background traffic, it is estimated that the roadway segments within the vicinity of the project would continue to operate at an acceptable level of service.

Chapter 6: Turn Lanes and U-Turns

6.1 Overview

For driveways, medians, and median openings, the placement and design of turn lanes and U-turns are critical to avoid potential traffic safety issues. For example, a median opening placed across a left-turn lane at an intersection could create conditions leading to a vehicular crash (See [Figure 27](#) or [Figure 28](#)). Locating these roadway openings is discussed in greater detail in [Chapter 2: Roadway Openings](#). This chapter will instead focus on where to locate and design turn lanes and U-turns and how they relate to driveways, medians, and median openings.

6.2 Exclusive Right-Turn Lanes

At driveways and intersections, an exclusive right-turn lane separates vehicles that are slowing or stopped to turn from the major road through traffic lanes. This separation minimizes turn-related collisions and eliminates unnecessary delay to through vehicles. Exclusive right-turn lanes are useful where a combination of high roadway speeds, and high right-turn volumes into a driveway are expected. Congestion on the roadway may also be a good reason to use an exclusive right-turn lane. If properly built, they remove the turning vehicle from the through lanes, thereby decreasing the operational and safety impact of right turning vehicles on the through traffic.

It is also important to consider potential pedestrian conflicts since the addition of a right-turn lane increases the crossing distance, time, and exposure for pedestrians. A well-designed right-turn lane can help to reduce pedestrian conflicts by slowing vehicle speeds, increasing pedestrian visibility, and reducing pedestrian exposure with a pedestrian refuge area.

6.2.1 When to Consider Exclusive Right-Turn Lanes

There are instances when adding an exclusive right-turn lane for unsignalized driveways and intersections is beneficial to traffic operations and safety. [Figure 74](#) provides guidance for two-lane and four-lane roadways based on the speed limit of the major roadway, major roadway approach volume, and how many right turns occur per hour. These recommendations are based primarily on the research done in [NCHRP Report 457, Evaluating Intersection Improvements: An Engineering Study Guide, Chapter 2 – Add a Right-Turn Bay on the Major Road](#).

Figure 74 | Recommended Guidelines for Exclusive Right-Turn Lanes to Unsignalized Driveway/Intersection

Source: [NCHRP Report 457](#), *TDOT Highway System Access Manual*

Here are some additional situations when adding an exclusive right-turn lane may be required:

- Facilities having a high volume of buses, trucks, or trailers (2 or 3 per hour), including:
 - o Trucking facilities (or other locations that have a high volume of large vehicle traffic such as water ports, train stations, etc.)
 - o Recreational facilities attracting boats, trailers, and other large recreation vehicles
 - o Transit facilities
 - o School driveways to drop-off and pick-up areas
- Poor internal site design of a driveway facility causing potential backups in the through lanes
- Heavier than normal peak flows on the main roadway
- Very high operating speeds (such as 55 mph or above) and in rural locations where turns are not expected by through drivers
- Highways with curves or hills where sight distance is impacted
- Gated entrances
- Crash experience, especially rear end collisions
- Intersections or driveways just after signalized intersections where acceleration or driver expectancy would make a separate right-turn lane desirable
- Severe skewed angle of intersection requiring right-turn vehicle to slow greatly

6.2.2 When Not to Consider Exclusive Right-Turn Lanes

- Dense or built-out corridors with limited space
- Right-turn lane that would negatively impact pedestrians or bicyclists
- Vehicular movements from driveways or median openings that cross the right-turn lane resulting in multiple threat crashes
- Context classifications C2T, C4, C5, or C6

6.2.3 Exclusive Right-Turn Lane Design

For information on exclusive right-turn lane design, refer to [FDM 212 - Intersections](#) and [Standard Plans, Index 711-001](#). The FDM states that “Right-turn lane tapers and lengths are identical to left-turn lanes under stop control conditions. Right-turn lane tapers and lengths are site-specific for free-flow or yield conditions.” Sheet 11 of Standard Plans, Index 711-001 provides requirements for clearance distance, brake to stop distance and deceleration distance by design speed for both curbed and uncurbed roadways. [Section 3.1.2: Median Opening Failures](#) provides discussion on the various parameters used in turn lane design such as decision distance, stopping distance, etc.

6.2.4 Important Considerations

Right-Turn Channelization

Where right-turn exiting channelization is used, be careful to provide a traffic entry angle that is easy for the exiting driver to negotiate while trying to enter traffic. [Figure 75](#) illustrates how driver head turn angles between 120°-125° (Tighter Angle) are more comfortable than the 145°-150° (Wide Angle) associated with more traditional designs. The tighter angle also encourages drivers to slow down, which provides more time for a thorough scan for conflicts.

Figure 77 | Raised Crosswalk at Channelized Right Turn

Source: [*City of Los Angeles Supplemental Street Design Guide*](#)

6.3 Exclusive Left-Turn Lanes

While some principles for right-turn lanes apply to left-turn lanes, there are inherent differences between them.

6.3.1 When Exclusive Left-Turn Lanes are Beneficial

There are several situations when a left-turn lane should be built on the roadway. For example, if on a multilane roadway and there is a median opening that is serving a driveway, there should be a left-turn lane to allow for vehicles to move safely out the way of the through traffic. Exclusive left-turn lanes should be considered at any location serving the public, especially on curves and where speeds are in excess of 45 mph. The [*AASHTO Green Book*](#) contains guidance on this issue. However, the guidelines were developed based on delay rather than crash avoidance. Safety is the main reason behind exclusive left-turn lanes.

6.3.2 When to Consider Exclusive Left-Turn Lanes at Unsignalized Intersections and Driveways

Left-turn lane warrants at unsignalized intersections and driveways were included in [*NCHRP Report 745, Left-Turn Accommodations at Unsignalized Intersections*](#). The recommended left-turn lane warrants are provided for the following roadway facilities.

- Rural, two-lane highways ([*Figure 78*](#))
- Rural, four-lane highways ([*Figure 79*](#))
- Urban and suburban roadways ([*Figure 80*](#))

Alternatively, the left-turn warrants based on [*NCHRP Report 457*](#), (See [*Figure 81*](#)) can be used if it is found to be more appropriate and reasonable for a local condition. Engineering judgment should be used when deciding between the NCHRP 745, and NCHRP 457 guidelines.

FDOT DESIGN MANUAL 212-1

MEDIAN TURN LANES MINIMUM DECELERATION LENGTHS

Brakes Applied After Turning
Vehicle Clears Through Lane;
Entry Speed:
10 mph Below Design Speed
For Low Speed Roadways
Average Running Speed For
High Speed Roadways

DOUBLE LEFT TURN

Brakes Applied After Turning
Vehicle Clears Through Lane;
Entry Speed:
10 mph Below Design Speed
For Low Speed Roadways
Average Running Speed For
High Speed Roadways

SINGLE LEFT TURN

MEDIAN TURN LANES					
Design Speed (mph)	Entry Speed (mph)	Clearance Distance L ₁ (ft.)	Brake To Stop Distance L ₂ (ft.)	Total Decel. Distance L (ft.)	Clearance Distance L ₃ (ft.)
25	15	70	25	95	90
30	20	70	50	120	100
35	25	70	75	145	110
40	30	80	75	155	120
45	35	85	100	185	135
50	44	105	185	290	160
55	48	125	225	350	195
60	52	145	260	405	230
65	55	170	290	460	270
70	58	200	325	525	300

NOTE:

- 1) For C3 Context Classification roadways with Design Speeds of 50 mph, the following values may be used under constrained conditions:
 - Entry Speed of 40 mph
 - Brake to stop distance (L₂) of 135 ft.
 - Total deceleration distance (L) of 240 ft.
- 2) For RRR Projects with Design Speeds of 50 mph and Entry Speeds of 40 mph, existing brake to stop distances (L₂) of 135 ft. and total deceleration distances (L) of 240 ft. may be retained.

1 Lane	*	970	1,110	**
2 Lane	*	1,700	1,850	**
3 Lane	*	2,620	2,730	**

	B	C	D	E
2 Lane	*	1,760	2,020	**
4 Lane	*	3,090	3,360	**
6 Lane	*	4,760	4,960	**

	B	C	D	E
2 Lane	*	19,600	22,400	**
4 Lane	*	34,300	37,300	**
6 Lane	*	52,900	55,100	**

Adjustment Factors

The peak hour directional service volumes should be adjusted by multiplying by 1.2 for one-way facilities
 The AADT service volumes should be adjusted by multiplying 0.6 for one way facilities 2 Lane Divided
 Roadway with an Exclusive Left Turn Lane(s): Multiply by 1.05
 2 lane Undivided Roadway with No Exclusive Left Turn Lane(s): Multiply by 0.80

Exclusive right turn lane(s): Multiply by 1.05
 Multilane Undivided Roadway with an Exclusive Left Turn Lane(s): Multiply by 0.95
 Multilane Roadway with No Exclusive Left Turn Lane(s): Multiply by 0.75
 Non-State Signalized Roadway: Multiply by 0.90

This table does not constitute a standard and should be used only for general planning applications. The table should not be used for corridor or intersection design, where more refined techniques exist.

* Cannot be achieved using table input value defaults.

** Not applicable for that level of service letter grade. For the automobile mode, volumes greater than level of service D become F because intersection capacities have been reached.
