

Weeki Wachee River SAV Restoration Project

Month 4 Maintenance Report

FDEP PERMIT NUMBER: 27-0192455-004-EI

USACE PERMIT NUMBER: SAJ-2019-01203

Prepared On:
October 1st, 2025

Prepared For:
Fish & Wildlife Foundation of Florida
P.O. Box 1101
Tallahassee, Florida 32302
Attn: Tindl Rainey

Prepared By:
Sea & Shoreline, LLC
4331 Cockroach Bay Rd
Ruskin, FL 33570

Date of Work Accomplished

The fourth monthly maintenance event for the Weeki Wachee River SAV Restoration Project was performed on September 29th, 2025.

Tasks Accomplished

1. Monitored Plant Growth and Survival
2. Removed biofouling from the GrowSAV™ Herbivory Exclusion Devices

Task Description

1. **Monitored Plant Growth and Survival** – A team of Sea & Shoreline biologists monitored planting units. Plant growth and survival were noted, and any displaced planting units were carefully replanted by hand. Monitoring was performed in water using a mask and snorkel.
2. **Removed biofouling from the GrowSAV™ Herbivory Exclusion Devices** – Biofouling that had accumulated on the top and side mesh of the GrowSAV Herbivory Exclusion Devices was removed by a team of Sea & Shoreline biologists using stiff-bristled scrub brushes. All biofouling removal was performed in water using a mask and snorkel.

Notes and Event Summary

Month 4 Maintenance and Monitoring Event

The fourth monthly maintenance event for the Weeki Wachee River SAV Restoration Project occurred on September 29th, 2025. The GrowSAV™ Herbivory Exclusion Devices exhibited light to moderate levels of biofouling, consisting mainly of settled sediments and attached filamentous algae. Sea & Shoreline biologists removed biofouling from the top and side mesh on mask and snorkel using stiff-bristled scrub brushes.

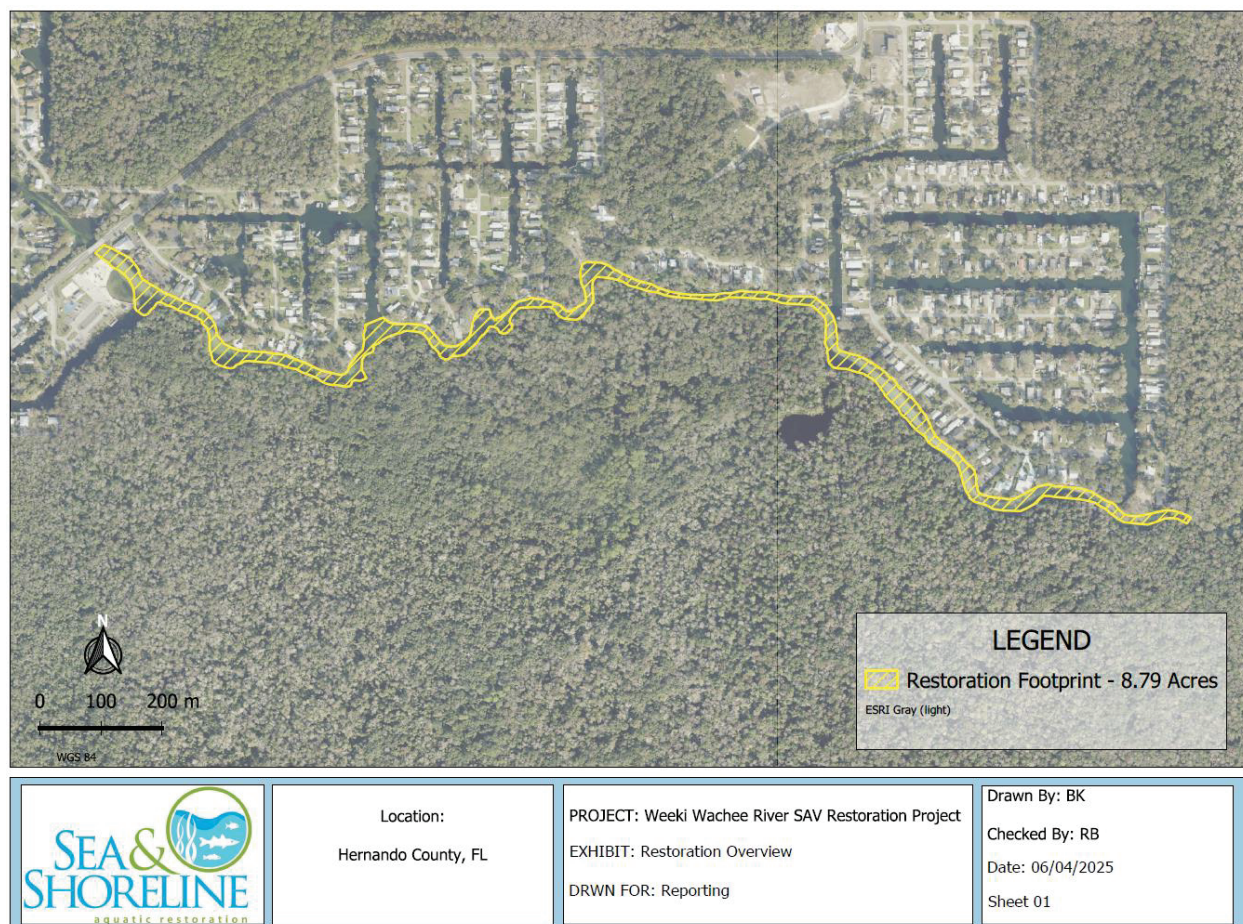

Four months after installation, both unprotected and protected planting units are showing very encouraging signs of growth and expansion throughout the river. Again, it is estimated that *V. neotropicalis* is present in 130/132 (98%) of the GrowSAV™ Herbivory Exclusion Devices, with coverages ranging from 2 to 4 on the Braun-Blanquet coverage scale. The blade height of protected units varies from 30 cm to 90 cm, with most units extending well beyond the top of their associated device (**Figure 7**). Signs of lateral expansion beyond protective devices were also observed throughout approximately 75% of devices, with some units extending up to 2 feet from their device (**Figure 6**). Protected planting units still have greater blade heights than the surrounding unprotected units, which is expected due to grazing pressure in the area. Despite this, blade heights of unprotected units range anywhere from 2 to 25 cm, with an average of 10 cm. Visible signs of lateral expansion were observed in unprotected planting units and new growth was observed in certain areas throughout the restoration footprint (**Figures 4 & 5**).

Water clarity has significantly improved since the last maintenance event, likely due to the decrease in storm events throughout the area.

Recommendations and Rectifications

There are no recommendations or rectifications currently, following the fourth monthly maintenance event, planting units are continuing to show encouraging signs of growth and expansion. Maintenance will continue for the next eight months, with the fifth event taking place in October 2025.
